Radio emissions point to an active galactic nucleus within a compact galaxy cluster. (File Photo) New Delhi: An object that can be seen from a whole earth is a very rare and interesting natural phenomenon, according to astrophysicists. First discovered on July 12, a natural, diffuse, patchy quasar that could be seen from the whole Earth. Although some speculations on the formation of such an object exist, the exact nature of the quasar remains a mystery. Besides being rare, these quasars are seen in the early universe and therefore serve as a perfect laboratory for studying the universe's history of formation, scientists say. Dr Pijush Bhattacharjee, head of the Inter-University Centre for Astronomy and Astrophysics, Post Bag 4, Ganeshkhind, Pune, told India Science Wire that although it is rare for us to see a diffuse object from the whole earth, they are still very common in space. "If we consider that a fully-blown active galactic nucleus (AGN) like a quasar is on the scale of galaxy, we can say that we don't see one from our whole galaxy every day," he said. The quasar was discovered using the powerful VLA (Very Large Array) radio telescope of the National Radio Astronomy Observatory (NRAO) in the US state of Virginia. "This quasar is unique. Being a natural object, no dark matter is involved and it is seen from our whole universe. Unlike other quasars, this one is very low in radio-loudness, so it is a kind of a natural radio-quiet quasar," Dr Bhattacharjee said. "It was discovered by chance, but the object is very interesting. It tells us about the formation of such an object in the early universe. There are some speculations that the quasar is formed from the collision of two galaxies or the impact of a cluster, but the exact mechanism is 82157476af
